

# AI Specialist. Build What's Next.

## Let's skip the corporate intro.

If you've ever spent a weekend building an AI agent just to see if you could, if you've automated something at work that nobody asked you to automate, or if you've caught yourself explaining to non-technical people why AI is genuinely exciting without being magic. This might be your role.

## The Opportunity

JENSEN-GROUP is a global industrial company. Heavy-duty laundry equipment. 2,500+ employees. Complex supply chains, service operations, and business processes across 20+ countries.

We're past the "exploring AI" phase. We're building it. AI agents that handle real work. Automation that actually ships. Solutions that make our people faster, not just impressed.

"AI amplifies people, it doesn't replace them. We're building systems that make our teams ten times more effective, not ten times smaller."

You'll work directly with JENSEN-GROUP Digital Management on an AI initiative that's already running. Not starting from zero.

## What We're Looking For

**AI-native thinker:** You understand how LLMs work, what agent frameworks do, and why prompt engineering takes real skill. You've built things with AI, not just used ChatGPT.

**Builder, not theorist:** Idea to prototype in days, not months. You ship. You iterate. You don't wait for perfect.

**Business translator:** You can sit in a room with Finance, Operations, or HR and turn their pain points into AI solutions they actually want to use. You speak human.

**Team player with initiative:** You'll be part of our IT team. A tight, international group across time zones. Independent but collaborative. No lone wolves.

**Daylight compatible:** You communicate clearly, people enjoy working with you, and you can explain complex AI topics without making everyone's eyes glaze over.

**Security-aware:** Governance, data protection, and access control matter. Non-negotiable.

**Fast learner with depth:** Contributing within weeks, not months. We're moving fast.

## What You'll Actually Do

- Design and deploy AI-powered agents and automations for real business use cases
- Work with teams across the organization to find where AI creates real value (not where it creates slides)
- Prototype, test, and iterate on AI solutions using modern frameworks and platforms
- Collaborate with IT on security, governance, and integration into existing infrastructure

- Help shape JENSEN's AI strategy from the inside. Hands-on proof, not PowerPoints

## **What's in it for You?**

**Direct impact.** No layers. Your work goes live, not into a backlog.

**Speed.** We go from idea to production in days. If that pace excites you, you'll fit right in.

**Growth without a ceiling.** This role doesn't exist yet in most companies. You'll define it.

**A team that has your back.** Flat structure, real support, and colleagues who actually want you to succeed.

## **Practical Stuff**

- Full-time, EU-based (remote-friendly)
- English mandatory. Additional European languages are a plus.
- Occasional travel to JENSEN locations (a few trips per year)
- Reports to JENSEN-GROUP Digital Management

## **What Actually Matters**

We don't care about your degree. We care about what you've built. Show us your projects, your repos, your automations. Tell us about the thing you built that nobody asked for but everyone ended up using. That's what gets you hired.

## **Sound like you?**

Show us what you've built. A repo, a demo, a side project, an automation that saved your team hours. If you haven't built anything yet but you've got the curiosity and the drive, tell us what you'd build first. Either way, we want to hear from you.

## **You Probably Shouldn't Apply If...**

- Your AI experience is limited to prompting ChatGPT and calling it "strategy"
- You write emails that start with "I hope this email finds you well"
- You need two weeks and three meetings to do what could be done in an afternoon
- You prefer talking about AI over building with it
- You think governance and security are someone else's problem
- You're looking for a role where you "manage AI initiatives" from a distance. This is hands-on.
